Rotating Shaft Modal Analysis With

Forced response analysis of an undamped distributed parameter rotating shaft is investigated by using a modal analysis technique. The shaft model includes rotary inertia and gyroscopic effects, and various boundary conditions are allowed (not only the simply supported case).

Modal analysis of a flexible, non-rotating rotor with a crack in a shaft is presented. The Jeffcott model of the rotor consists of the massless shaft and a disk concentrating the mass of the full system. The model includes ball bearings supporting the shaft and the model of the transverse shaft crack located near the disk. Simulation results present changes in natural frequencies of the system ...

I am seeing a very nice explanation of Modal analysis. I am analyzing an ultrasonic horn whose one face is attached with a vertical rotating tool, while other face is attached with transducer. Now pls tell me should i fix the horn from transducer side for modal analysis, leaving free at rotating tool side. and what i do for harmonic study.

A modal analysis gives us specific information on the characteristics of the structure instead of reporting a response; What a modal analysis tells us is at which frequency the structure will absorb all the energy applied to it, and what the shape looks like which corresponds to this frequency.
