**Reversible Reactions And Equilibrium Concept**

Equilibrium can be a tricky concept to understand, but this graphic tries to make it a little clearer. Firstly, let's clarify what equilibrium is. When we have a reversible reaction taking place in a closed system – that is, one where no substances are being added or lost – at the beginning of the reaction we will have only the reactants.

if a reversible reaction takes place in a closed system (no reactants can escape) To begin with, the rate of the forward reaction is fast and the rate of the reverse reaction is zero. As more products are made, the rate of the forward reaction decreases and the rate of the reverse reaction increases.

A reversible reaction is a chemical reaction where the reactants form products that, in turn, react together to give the reactants back. Reversible reactions will reach an equilibrium point where the concentrations of the reactants and products will no longer change.

In this video we cover the basic concept of chemical equilibrium. Here we are introduced to the idea of chemical reactions as being reversible.

**Chemical Equilibrium - Reversible Reactions**

Key Concepts. Equilibrium reactions are reversible chemical reactions. This is shown in chemical equations by using the "equilibrium arrow"  $1 \rightleftharpoons$  Forward reaction goes to completion: ... Once a system has reached equilibrium the concentration of reactants and products remains constant (this is how chemical equilibrium is defined!).

This page looks at the basic ideas underpinning the idea of a chemical equilibrium. It talks about reversible reactions and how they behave if the system is closed. This leads to the idea of a dynamic equilibrium, and what the common term "position of equilibrium" means. A reversible reaction is one ...

The concept of a reversible reaction was introduced by Berthollet in 1803, after he had observed the formation of sodium carbonate crystals at the edge of a salt lake (one of the natron lakes in Egypt, in limestone):  $2\text{NaCl} + \text{CaCO}_3 \rightarrow \text{Na}_2\text{CO}_3 + \text{CaCl}_2$ . He recognized this as the reverse of the familiar reaction  $\text{Na}_2\text{CO}_3 + \text{CaCl}_2 \rightarrow 2\text{NaCl} \dots$

The previous lesson introduced students to reversible reactions and the concept of equilibrium. Today's lesson will reinforce both concepts using a computer simulation to help us observe the particles as they "react". We begin with a bellringer that I had planned to be the previous day's exit ticket.

Predicting the Direction of a Reversible Reaction. Le Châtelier's principle can be used to predict changes in equilibrium concentrations when a system that is at equilibrium is subjected to a stress. However, if we have a mixture of reactants and products that have not yet reached equilibrium, the changes necessary to reach equilibrium may not be so obvious.

Many chemical reactions are reversible, and the forward and backward reactions can occur at the same time. When the rate of the forward reaction is equal to the rate of the backward reaction, we call that a dynamic equilibrium. We will learn how equilibrium can be described by the equilibrium constant  $K$ , and how different factors than can affect the chemical equilibrium.
