Chapter Resources: Plant Reproduction

Plant Reproduction. The seed coat is the sporophyte, while the inside is the gametophyte. One cell in the megasporangium (the megasporocyte), enlarges and through meiosis produced 4 haploid cells. (Megaspore) Only one of these cells survive. The one that survives and becomes one and divides 3 times through mitosis.

Plant Reproduction. Flashcards | Quizlet

Spores are just a single cell. Seeds can be spread by wind, animals, or water. Spores are mostly carried by the wind. The sperm of seed plants, unlike the sperm of mosses and ferns, do not need water to reach the egg. One important similarity between a seed and a spore is that both can grow into a new plant.

KEY CONCEPT Seeds and pollen are reproductive adaptations.

Plant reproduction. Asexual reproduction produces new individuals without the fusion of gametes, genetically identical to the parent plants and each other, except when mutations occur. In seed plants, the offspring can be packaged in a protective seed, which is used as an agent of dispersal.

Plant reproduction - Wikipedia

Learning Objectives. In seed plants, the evolutionary trend led to a dominant sporophyte generation, and at the same time, a systematic reduction in the size of the gametophyte: from a conspicuous structure to a microscopic cluster of cells enclosed in the tissues of the sporophyte. Whereas lower vascular plants, such as club mosses and ferns,...

Evolution of Seed Plants | Biology II - Lumen Learning

Plant reproductive system, any of the systems, sexual or asexual, by which plants reproduce. In plants, as in animals, the end result of reproduction is the continuation of a given species, and the ability to reproduce is, therefore, rather conservative, or given to only moderate change, during evolution.
