Underground pipeline structures may contain multiple failure modes in which any of the modes can lead to a system failure. These failure modes are a time-variant process, and failure rate increases with the lapse of time. The failure modes may be correlated due to common random variables. In many cases, failure modes are assumed to be independent, and underground pipeline failure is evaluated ...

ABSTRACT Underground mines possess a wide variety of mobile capital intensive equipment. Equipment failures and the associated down time contribute significantly to the overall maintenance, operating and production costs of the mine. With the introduction of computerized maintenance records and data logging, the collection and analysis of accurate and reliable data are much simplified.
