Polymerase chain reaction (PCR) is a common laboratory technique used to make many copies (millions or billions!) of a particular region of DNA. This DNA region can be anything the experimenter is interested in. Typically, the goal of PCR is to make enough of the target DNA region that it can be analyzed or used in some other way.

DNA microarray analysis helps as the bacterial genomic DNA often outlasts the viability of the bacteria and a diagnosis can be made using a small amount of DNA, as opposed to the large numbers of bacteria needed for culture. In future, an abscess specimen might be sent not for culture and sensitivity testing, but rather for DNA microarray analysis.

Microarray and its applications - PubMed Central (PMC)

How the right consumables can help you. Even smallest traces of DNA contaminants could lead to false results. Avoiding contamination during forensic sample preparation is as important as the use of contamination- free reagents and consumables, e.g. tubes and pipette tips.

Forensic - Eppendorf

DNA analysis intended to identify a species, rather than an individual, is called DNA barcoding. DNA profiling is a forensic technique in criminal investigations, comparing criminal suspects' profiles to DNA evidence so as to assess the likelihood of their involvement in the crime.
